Abstract. In this paper we use an analytical-numerical approach to find, in a systematic way, new 1-soliton solutions for a discrete sine-Gordon system in one spatial dimension. Since the spatial domain is unbounded, the numerical scheme employed to generate these soliton solutions is based on the artificial boundary method. A large selection of numerical examples provides much insight into the possible shapes of these new 1-solitons.

Key words: Sine-Gordon equation, soliton solutions, numerical single solitons, artificial boundary method.

1 Introduction

The sine-Gordon equation,

$$\frac{\partial^2 u}{\partial t^2} - \frac{\partial^2 u}{\partial x^2} + \sin(u) = 0 \tag{1.1}$$

is a semilinear hyperbolic equation in 1+1 dimensions. This PDE has its origin in the 19th century where it arose in the study of surfaces of constant negative curvature (cf. [1]). In the second half of the 20th century the sine-Gordon equation has attracted considerable attention, owing to its importance in the mathematical modeling of various physical phenomena, for example in nonlinear optics (propagation of pulses in resonant media); superconductivity (wave propagation in a Josephson transmission line); condensed matter

physics (charge density waves in periodic pinning potentials); and in solid state physics (propagation of a dislocation in a crystal). Details and additional examples can be found in [2–5].

A very important property of the sine-Gordon equation (1.1) is the existence of soliton solutions. Many of these special solutions have been obtained in closed form, by using analytical methods such as Bäcklund transformations [6], the nonlinear separation of variables method [2]; see also [3] (Chapter 6). The known soliton solutions of (1.1) mainly can be classified as follows:

1. 1-soliton solutions: Two 1-soliton solutions are given by [7,8]

$$u(x,t) = 4\arctan\left\{\exp\left(\pm\frac{x-\mu t - x_0}{\sqrt{1-\mu^2}}\right)\right\}, \quad \mu^2 < 1,$$
 (1.2)

and

$$u(x,t) = -\pi + 4\arctan\left\{\exp\left(\pm\frac{x - \mu t - x_0}{\sqrt{\mu^2 - 1}}\right)\right\}, \quad \mu^2 > 1.$$
 (1.3)

Here, $x_0, \mu \in \mathbb{R}$ and $|\mu| \neq 1$.

2. Breather solutions: Two breather solutions to (1.1) are given by [7,8]

$$u(x,t) = 4\arctan\left\{\frac{\mu\sinh(kx+A)}{k\cosh(\mu t+B)}\right\}, \quad \mu^2 = k+1, \tag{1.4}$$

and

$$u(x,t) = 4\arctan\left\{\frac{\mu\sin(kx+A)}{k\cosh(\mu t+B)}\right\}, \quad \mu^2 = 1 - k^2 > 0.$$
 (1.5)

Here, A and B are arbitrary (real) constants, and the real numbers μ and k are related by the conditions in (1.4) and (1.5), respectively.

3. N-soliton solutions: An N-soliton solution for (1.1) is given by

$$u(x,t) = x + \arccos\left\{1 - 2\left(\frac{\partial^2}{\partial x^2} - \frac{\partial^2}{\partial t^2}\right) \ln F(x,t)\right\},\tag{1.6}$$

with

$$F(x,t) := \det[M_{ij}], \qquad M_{ij} := \frac{2}{a_i + a_j} \cosh\left(\frac{z_i + z_j}{2}\right),$$

$$z_i := \pm \frac{x - \mu_i t + C_i}{\sqrt{1 - \mu_i^2}}, \qquad a_i := \pm \sqrt{\frac{1 - \mu_i^2}{1 + \mu_i^2}}.$$
